

## SURGERY INSTRUCTIONS The Methodist Hospital

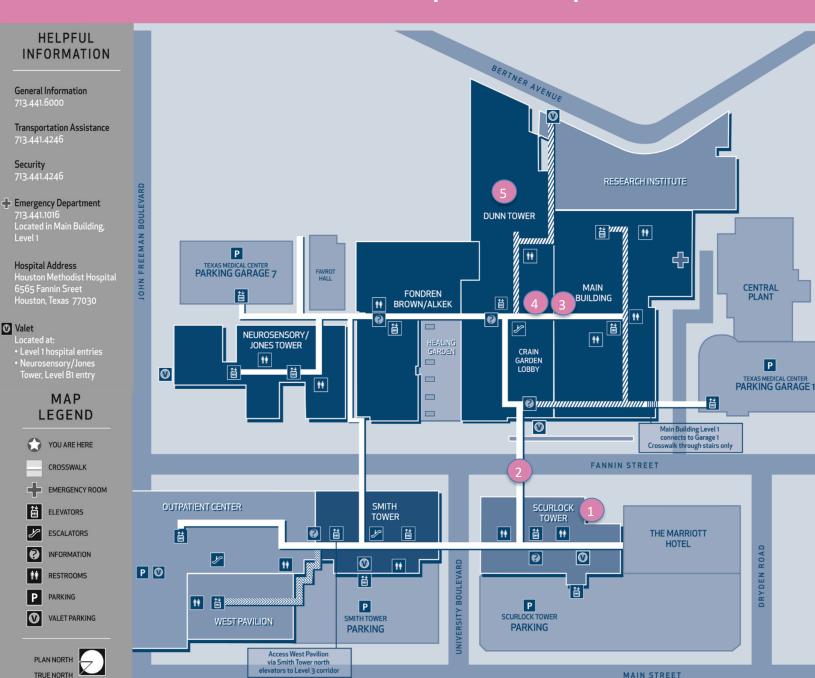

Your surgical procedure with Dr. Spiegel has been scheduled at Houston Methodist Hospital in the Medical Center. Please report to The Methodist Hospital, 6565 Fannin, on the 3rd floor of the Main building, Main 3 NW. Their phone number is 713-441-1034.

Please follow the instructions below:

- Pre-register for your surgery with the hospital by calling patient registration at 713-394-6805.
- You will need an appointment with the pre-operative anesthesia evaluation clinic (APEC) prior to your surgery date. You will be assessed by anesthesia and will have any blood work or other testing done while you are there. Please bring a list of any medications, vitamins, or supplements you are currently taking. You may walk-in without an appointment, however patients that have appointments will be seen before those that do not. If you would like to secure an appointment, please call 713-441-6504, option 3. You should expect your appointment to take approximately an hour. The pre-operative assessment center is located in the Scurlock Tower, on the 3rd floor, at 6560 Fannin Street. The hours of operation are 10 AM 6 PM, Monday through Friday.
- Please **start** taking iron supplementation with vitamin C as soon as possible.
- Do not take aspirin or products containing aspirin, vitamin E, fish oil, herbal supplements, or any medications that
  would cause bleeding, 3 weeks prior to surgery. If you are taking Tamoxifen/Arimidex, you will need to stop this
  medication 3 weeks prior to surgery as well. Attached is a list of medications not to be taken 3 weeks before
  surgery. Take Tylenol if necessary.
- Do not smoke for at least 8 weeks before and 6 weeks after surgery. Avoid nicotine gum and patches.
- **Do not** eat or drink anything after midnight the night before or the morning of your surgery unless otherwise instructed at your pre-operative assessment visit.
- Please purchase the recommended compression garment (if having liposuction) PRIOR to surgery. Please refer
  to the compression garment information emailed to you.

If you have any questions, please call the office at 713-441-6102.

## **Pre-Operative Instructions**

8 Weeks Before Surgery					
Smoking					
Smoking compromises blood flow by causing spasm of blood vessels and significantly increases the risk of wound healing problems. Therefore, DO NOT SMOKE for at least 8 weeks before and 6 weeks after surgery. This also applies to second hand smoke; therefore do not stay in rooms with cigarette smokers.					
3 Weeks Before Surgery					
Pre-operative Labs					
Preoperative lab work must be obtained and reviewed prior to surgery. The lab work and testing will need to be completed 3 weeks prior to surgery.					
2 Weeks Before Surgery					
Medications					
Do not take any medication containing aspirin or anti-inflammatories (Advil, Aleve), including cold formulas, for at least 2 weeks prior to surgery. Please let us know if you are taking or have been taking any herbal supplements, fish oil or vitamin E. These will need to be discontinued 2 weeks prior to surgery. Please refer to the Medication List link for some frequently used medications that contain aspirin or an anti-inflammatory. These compounds have a tendency to decrease the average clotting capacity and increase bleeding during surgery. Tylenol may be used instead as it does not have these untoward effects. If you are on <b>Tamoxifen</b> , you need to stop taking this medication <b>3 weeks</b> before surgery.					

1 Week Before Surgery				
Hibiclens® Soap				
Use Hibiclens® (over-the-counter antibacterial skin cleanser) in the shower instead of soap for 3 days prior to surgery. Apply the minimum amount of Hibiclens® necessary to cover the skin from shoulders to thighs and wash gently. Rinse again thoroughly (be careful not to get the product on your face, eyes, or ears). You do not need a prescription for this.				
Notification of Illness				
Notify our office promptly if cold, fever, or any illness appears before surgery. Call in any allergies, medications, or conditions you may have forgotten to tell us about.				
Night Before Surgery				
Eating and Drinking				
<b>Do not eat or drink anything after midnight the night before surgery</b> unless you are otherwise instructed at your preassessment appointment. If you are diabetic and take insulin you will be instructed how to take your medication and discuss this with your anesthesiologist during the preoperative visit.				
Arrival for Surgery				
Please be punctual. If you are running late please call ahead, but be aware that not arriving on time may cause cancellation of your surgery. Please report to Methodist Hospital, 6565 Fannin, to the 3rd floor of the Main building which is Main 3NW for admission. Their phone number is 713441-1034. Dr. Spiegel will see you the morning of surgery to address any last minute questions or concerns. She will place your pre-operative markings at that time.				

Pre-Operative Instructions
Symmetry/Revisions

Updated May 2020

#### Dear Patient,

Please be aware that we **will not** contact you if your pre-operative work-up is **normal**, however, rest assured we **will** contact you if any of your test results are **abnormal**. If you would like a copy of your results, we can make them available at your next visit.

Sincerely,

Dr. Aldona J. Spiegel

### **Post-Operative Instructions**

#### Medications

There are 2 medications that you will be prescribed after surgery:

- 1. Antibiotic- always complete antibiotic prescription as prescribed by your provider, without missing a dose
- 2. **Pain Medication** to be taken as needed, you may take Tylenol if you do not feel like you needed a stronger medication. Pain medication might make you feel groggy and constipated and cannot be mixed with alcohol. It is also not safe to drive while taking pain medication

**Do Not** take aspirin or anti-inflammatories such as ibuprofen (Motrin/Advil) or naproxen (Aleve) for at least 48 hours after surgery.

#### Swelling

After surgery, your breast(s) will feel swollen around the incisions, especially at the end of the day. This is normal and usually takes at least a month or more to resolve. If you have signs of redness, swelling or separation of the skin at the surgical site, a temperature above 101 degrees, increased pain at the surgical site, increased drainage output or bad odor from the surgical site, contact our office at 713-441-6102.

#### **Incision Care**

Check incision sites daily. Some of your incisions may be covered with Dermabond tape or Steri Strips which will be removed in clinic. The incisions may have minimal draining which will discolor the tape/strips. If you have persistent draining please call our clinic. You may also have bruising (black, blue, or purple) at any of your surgical incisions which is normal. If you had liposuction, you may experience more discomfort and bruising in this area. **Do not** submerge your incisions in a bath, pool, etc. until cleared by your doctor.

#### Showering

You will be able to shower 48 hours after surgery. Remove surgical bra and gauze before showering. Shower with your back to the water. Allow the surgical incisions to dry before replacing your bra. Do not apply powder, creams, ointments, or lotion to incisions until completely healed. Baths can be resumed 1 month after surgery and swimming 8 weeks after surgery.

#### Activities

**Do not** lift, push, or pull objects over 10 pounds until you are released to resume normal activities. **No** exercise or weight training for at least 3 weeks to avoid straining your incisions. **Don't** push a vacuum or do other strenuous housework until you have been seen and cleared in the office.

#### **Sleep Position**

You should only sleep on your back and avoid sleeping on the breasts for at least 6 weeks after surgery. If you prefer, you might find a recliner helpful to prevent you from rolling on your side while sleeping.

#### Work

You will be able to return back to a desk job, or light duty approximately one - two weeks after surgery. Be mindful that this should be gradual because you will feel tired more quickly and lack the normal reserve of energy.

#### Support

You will need someone to help you when you return home for the first few days. Ask you friends and family to help you with chores and errands while you recover.

#### Driving

You may start driving after you have stopped all pain medication. It is best to wait at least two weeks after surgery, in order to feel confident when driving.

#### Smoking

**ABSOLUTELY NO SMOKING** for six weeks after surgery (this includes staying out of rooms with smokers).

#### Mammograms

Routine breast imaging/mammogram should be performed as directed by your primary care physician.

Breast imaging must be up to date within 6 months of your scheduled procedure. We ask that you do not undergo a mammogram after surgery until you are 6 months post op.

# Scar Therapy

#### SCAR THERAPY RESULTS

Before and after photos of Silagen Scar therapy

### Silagen

#### WHY DO I NEED IT?

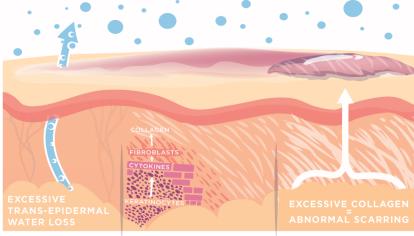

It is natural to be concerned about scars. Some patients, are genetically prone to hypertrophic or keloid scar formation, including those with more pigmented skin. In clinical studies Silagen sheeting showed a greater and faster improvement in scar maturation. Silagen Silicone Gel Sheeting is made with the highest quality medical grade silicones. The 1mm thick sheets, strips and shapes feature and advanced adhesion technology which means they conform well to the body and remain in place. They can be washed and reused for up to 4 weeks.

#### HOW DOES IT WORK?

Silagen creates a protective barrier over the scar, which increases hydration and provides the optimal environment to normalize collagen production. This will help flatten and soften your scar, and reduce redness, discoloring, itching, and pain. You will begin to see results in as little as 3 weeks, but best results are seen after 3 months.

#### HOW DO I USE IT?

You can start using the Silagen 8 weeks after surgery as long as there are no open areas or scabbing. You place it on your incision(s) and wear it for 6 – 24 hours. The longer you wear the Silagen, the better the results.

Scar tissue exhibits excessive TEWL for as long as one year post-wound healing. This abnormally high level of water evaporation stimulates keratinocytes to produce cytokines, which in turn signal the activation of fibroblasts to synthesize collagen.

Left unchecked, excessive collagen production can lead to abnormal scarring.

Silicones applied over the scar provide occlusion and hydration of the stratum corneum, down-regulating keratinocyte stimulation and prevent further signaling to produce more collagen.
